

Fishery

Stork's Nest farm provides a more than 100 meter long and 10 meter wide fishpond, which is surrounded by 100ts of berry bushes and fruit trees.

Plan is it to provide living fish for consumption – the conditions, especially water quality allows breeding specific fishes apart from local ones.

Water quality and biological water purification by biological aeration, fountaining and a integrated biodiversity allows providing best conditions for fishes with increased requirements on water quality.

The pond provides beside the fish production our base for breeding of ducklings and duck egg production.
